

Why buy from iScan?

iScan invested a lot of resources in creating a powerful application which is also simple to use. What differentiates our product from the competition is the following:

Ease of use.

Considerable effort was made to make the user interaction with SimpleDOX as pleasant and easy as possible. The best way to judge is to install the software and try it in demo mode.

Concurrent licensing.

You can purchase 5 user licenses and install them on 10 or more workstations; however, only 5 users can access the system at any given time.

Full License.

We don't hold anything back! You get all the features of SimpleDOX including OCR and legal archive/backup.

Non proprietary file and data formats.

We use Microsoft database engines and file formats that are the de facto standard of the industry. Data can be exported to other systems with no difficulties and our database engine is ODBC compliant so other systems can link and use our system resources.

OEM universal interface.

iScan engineers developed a universal interface that other applications can use to interact with SimpleDOX and integrate the two systems together. If a customer is using a software application specific to their industry, iScan engineers will work with your software provider to link the two applications together.

Legal Archives & Backups.

Our ArchiveDOX module is by far one of the most powerful applications in its class. CD-R media archives created by ArchiveDOX conform to Federal and State regulations making the CD media as legal as the original paper documents. ArchiveDOX CD media can be protected by any one or all five methods of data protection including 256 bit key encryption. Use all 5 methods and even the NSA spooks will spend long nights trying to break into the system. The ArchiveDOX report generator keeps track of each volume created. All relevant information about what data files exist on the volume, who created the volume, when it was created, and other statistical data.

Image data file format

SimpleDOX uses the TIFF graphic file format to store its scanned paper files to conform to federal and state electronic record guidelines. For electronic files imported into the system such as Microsoft word or excel, a TIFF formatted copy is also generated and stored in the system. Other competitive products use GIF/JPEG format to reduce disk storage at the expense of legal archive guidelines.

Database Support Limitations

Contrary to a common industry practice of limiting the number of databases that the user can create, SimpleDOX imposes no limit on how many databases the user can create.

Technical Support

iScan provides unlimited email support for the first year and free version-specific software updates.

Current owners of SimpleDOX version 4.0 will get 50% discount on the upcoming .NET version.
